01

Introduction

G2A Booking Engine is a production-grade WordPress booking plugin built for firearms ranges and training facilities. It replaces SaaS booking tools with a fully-owned solution — no monthly fees, no per-seat pricing, no data living on someone else's server.

Built for

Firearms ranges, shooting clubs, CCW class operators, hunter safety instructors, private training facilities, and any business managing time-slot reservations across multiple resources (lanes, classrooms, instructors, equipment).

What it does

Every booking flow your range needs, from a customer clicking a calendar slot to receiving a branded PDF invoice in their inbox 30 seconds after payment clears.

CAPABILITY	WHAT IT MEANS FOR YOU	STATUS
Real-time availability	No double-bookings. Server validates every slot.	LIVE
6 SEO landing templates	/event/{slug}/ pages with full JSON-LD schema.	LIVE
Modular addon system	Toggle features on/off without code edits.	LIVE
Multi-gateway payments	Stripe, PayPal, Fortis, Authorize.net, WooCommerce.	LIVE
Email automation	8 lifecycle templates with reminder cron.	LIVE
Branded PDF invoices	Logo, colors, tax — auto-attached to receipts.	LIVE
AI customer support	OpenRouter free-tier LLM drafts replies.	LIVE
Custom form builder	17 field types, drag-drop, conditional logic.	LIVE
REST API	Full bookings + availability + resources endpoints.	LIVE
SEO + schema	Event, Course, LocalBusiness, FAQ, Speakable graphs.	LIVE
Twilio SMS	Booking reminders by SMS.	SOON
IMAP inbox	Read + auto-reply to range@ mailbox.	SOON

NOTE This plugin is a custom build for Guns 2 Ammo and is being developed into a commercial Wordpressistic product (working name: **RangeBook Pro**). Some features may be marked Pro or Agency-only depending on your license.

02

Installation & First-Run Setup

System requirements

WordPress	6.2 or higher
PHP	8.0+ (recommended 8.2)
MySQL	5.7+ or MariaDB 10.4+
HTTPS	Required for payment processing
Memory limit	256 MB minimum, 512 MB recommended
Disk space	~15 MB plugin + ~5 MB per 1000 invoices

Installing the plugin

- 1. Upload via FTP** Extract the plugin .zip and upload the g2a-booking-engine folder to /wp-content/plugins/.
- 2. Activate** Visit *WP Admin* → *Plugins* and click **Activate** on G2A Booking Engine. Activation creates 8 database tables and seeds default lanes, business hours, and a starter form.
- 3. Welcome screen** You'll be redirected to *G2A Booking* → *Bookings* with the welcome flag set. From here, head to *Settings* → *General* to fill in your business details.

First-run setup checklist

Spend 15 minutes here and the rest of the plugin works out of the box.

1	Settings → General	Business name, phone, address, currency, time zone.
2	Settings → Branding	Upload logo URL. Set primary color (#4A5D3A military green) and accent (#D2691E burnt orange).
3	Resources	Confirm seeded lanes 1-6 are correct. Add classrooms or instructor resources if you offer them.
4	Booking Types	Edit the default Lane Booking type. Set duration (60 min default), base price, and which form to use.
5	Availability	Adjust default Mon-Sat 10am-8pm hours per resource. Add holiday blackouts.
6	Settings → Payments	Enter Stripe / PayPal credentials. Toggle Test Mode for the first booking.

-
- | | | |
|----------|--------------------------|---|
| 7 | Settings → Addons | Activate Email Automation, PDF Invoices, AI Auto-Reply. |
|----------|--------------------------|---|
-
- | | | |
|----------|---------------------|---|
| 8 | Test booking | Place a \$1 booking on a hidden lane to verify the entire flow before going live. |
|----------|---------------------|---|
-

CRITICAL Always do step 8. A real test booking with a real card (your own) catches webhook mis-configurations that test-mode never reveals.

The Plugin at a Glance

Once active, G2A Booking Engine adds a new top-level menu in WordPress admin called **G2A Booking**. Everything lives there.

Menu structure

Dashboard	Live KPIs: bookings today, revenue this month, no-show rate, upcoming missions, status breakdown.
Bookings	Roster view of every reservation. Filter by status, date, lane, customer.
Resources	CRUD for lanes, classrooms, instructors, equipment.
Booking Types	Per-type pricing, duration, capacity, landing template.
Forms	Drag-and-drop form builder with 17 field types.
Availability	Business hours per resource and blackout dates.
Payments	Transaction log with refund tools.
Reports	Daily/weekly bookings chart, revenue, top resources, top types.
Settings	Tabbed config: General, Addons, Payments, [module tabs], Branding, Danger Zone.
Tools	Schema migrations, data reset, export.

Frontend touchpoints

Three shortcodes plus auto-generated SEO landing pages.

`<code>[g2a_lane_booking_flow]</code>` Full stepped lane booking flow with real-time slot picker.

`<code>[g2a_booking_form]</code>` Render any saved form by ID.

`<code>[g2a_booking_calendar]</code>` Month calendar view (Phase 2).

`<code>[g2a_event_banner]</code>` Hero banner for next upcoming event.

`<code>[g2a_upcoming_events]</code>` List of upcoming events filtered by category.

`<code>/event/{slug}/</code>` Auto-generated SEO landing page with full JSON-LD schema.

`<code>/g2a-events-sitemap/</code>` Sitemap of every active event for search engines.

Database tables

All custom data lives in dedicated wp_g2ab_* tables — no post type pollution.

wp_g2ab_bookings	Every reservation, with UUID, status, payment metadata.
wp_g2ab_resources	Lanes, classrooms, instructors, equipment.
wp_g2ab_booking_types	Lane / class / membership types with pricing rules.
wp_g2ab_forms	Form definitions and metadata.
wp_g2ab_form_fields	Fields for each form, ordered.
wp_g2ab_availability_rules	Hours and blackouts per resource.
wp_g2ab_payments	Transaction log linked to bookings.
wp_g2ab_logs	Audit log of every action — emails sent, status changes, webhook hits.

04

Admin Dashboard

The Command Center page is your live operational view. It refreshes on every load and shows the next 30 days of activity.

KPI Cards

Four metrics across the top:

Bookings (this month)	Total reservations created in the current calendar month, with month-over-month delta.
Revenue (this month)	Sum of paid bookings. Excludes cancelled and refunded.
Avg Value	Revenue ÷ paid booking count. Useful for tracking upsells.
No-Shows	Percentage of confirmed bookings marked no-show.

Charts and breakdowns

Below the KPIs:

- **30-Day Booking Trend:** sparkline showing daily booking volume.
- **Status Breakdown:** donut chart of pending / confirmed / paid / completed / cancelled.
- **Top Resources:** last-30-day leaderboard of which lanes are most-booked.
- **Upcoming Missions:** next 8 confirmed bookings.
- **Recent Activity:** last 10 booking events.

TIP All charts are pure CSS — no Chart.js, no external libraries, no admin-side bloat. The page loads in under 200ms even with 10k bookings in the database.

05

Bookings — Managing Reservations

The Bookings page is your daily roster. Every reservation — pending, paid, or cancelled — is listed here.

Filters

Filter by status (8 status types), date range, lane/resource, booking type, or search by customer name/email/UUID.

Status lifecycle

pending	Reservation created, payment not yet attempted.
reserved	Slot held but not confirmed (deposit pending or pay-in-store).
confirmed	Admin manually confirmed (often after PMPPro membership check).
paid	Payment cleared. Customer received confirmation email.
cancelled	Customer or admin cancelled before the session.
completed	Session occurred. Triggers post-visit review email.
no_show	Customer didn't arrive. Optional fee applied.
refunded	Payment returned to customer.

Adding a manual booking

Click **Add Booking** to walk through the lane / time / customer / payment fields. Useful for phone bookings or admin overrides. Manual bookings can skip the customer-facing email flow if needed (toggle in the form).

Bulk actions

Select multiple rows in the table to bulk-cancel, bulk-confirm, or bulk-export to CSV. Bulk-cancel automatically fires the cancellation email per row (set the toggle to skip if you don't want notifications).

TIP Want to manually mark a booking paid (e.g. cash payment recorded later)? Open the booking, set status to **paid**, and the system fires the `g2ab_booking_paid` hook — which means the PDF invoice generates and the receipt email goes out automatically.

06

Resources — Lanes, Classrooms, Equipment

A **resource** is anything that can only be used by one booking at a time. Lanes, classrooms, instructors, equipment packages — they all share the same model.

Resource types

lane	Shooting bay. Capacity = 1 (or 2 for double-wide lanes).
classroom	Training room. Capacity = max students for the class.
instructor	Specific named trainer. Used when you want to let customers pick "Sarah" or "Mike".
equipment	Rental package (Glock 19, AR-15, etc). Used for time-slot rentals separate from lanes.

Configuring a resource

Each resource has:

- **Name:** public-facing label ("Lane 03", "Sarah Mitchell")
- **Slug:** URL-safe identifier auto-generated
- **Type:** lane / classroom / instructor / equipment
- **Capacity:** how many simultaneous bookings allowed
- **Sort order:** position in the lane picker
- **Active:** toggle to hide without deleting
- **Settings JSON:** optional metadata (caliber rating, age restrictions, etc.)

Buffer time

In a resource's settings JSON you can set `buffer_minutes_before` and `buffer_minutes_after` — useful for cleaning lanes between sessions. The availability engine respects these automatically.

07

Booking Types

A **booking type** is a product. Lane Booking, CCW Class, Range Membership, Hunter Safety Course — each is a separate type with its own price, duration, form, and SEO landing page.

Categories

lane	Time-slot reservations on a shooting lane. Default 60 min, \$19-\$45.
class	Scheduled training session. Multi-student classroom + instructor.
membership	Monthly or annual range access. Triggers PMPro level on payment.

Per-type configuration

Edit a booking type to set:

- Name and slug (used in URL: /event/{slug}/)
- Category (lane / class / membership)
- Duration in minutes
- Base price (per shooter)
- Min / max party size
- Form to use (from the Forms list)
- Allowed resources (which lanes can fulfill this type)
- Landing template (one of 6 SEO designs)
- Featured image URL
- SEO meta title + description override

Landing page templates

Each booking type can use one of 6 unique landing designs:

tactical_lane	Dark tactical hero, lane visual, stat blocks. Best for lane bookings.
ccw_class	Class schedule grid, instructor bio, syllabus.
hunter_safety	Outdoor green palette, course modules, AZ certification badges.
private_lesson	1-on-1 framing, instructor cards, pricing tiers.
range_membership	Tier comparison table, perks list, signup CTA.
tactical_training	Multi-day course layout, gear list, prerequisites.

TIP Each landing template auto-generates JSON-LD schema (Event, Course, LocalBusiness, FAQPage, Speakable, BreadcrumbList) so Google Rich Results show your prices, dates, and ratings directly in search.

08

Forms — Custom Booking Forms

Build the booking form your range needs. 17 field types, drag-drop ordering, conditional logic, waiver checkboxes.

Field types

Text	Single-line text input.
Email	Email validation built-in.
Phone	Tel input with formatting hints.
Number	Numeric only with optional min/max.
Date	Native date picker.
Time	Native time picker.
Dropdown	Select with custom options.
Radio	Single-choice list.
Checkbox	Boolean toggle.
Multi-checkbox	Multi-select list.
Hidden	Hidden value (UTM tracking, etc.).
Waiver	Required checkbox with linked PDF.
Terms	Required terms acceptance.
Textarea	Multi-line input.
File upload	For ID photos or signed waivers.
Section header	Visual divider in the form.
Description	Rich-text helper paragraph.

Conditional logic

Each field can be conditionally shown/hidden based on another field's value. Example: only show the "Years of experience" field if "Have you shot before?" is set to Yes.

Required fields and waivers

Mark a field **required** to enforce client-side and server-side validation. Waiver fields automatically log acceptance with timestamp + IP into the bookings table for compliance.

09

Availability Rules & Blackouts

This is the brain of the booking engine. The availability engine computes open slots in real time by combining business hours, existing bookings, buffer times, and blackout dates.

Business hours

Default seeded values: Monday-Saturday 10:00am-8:00pm, Sunday 11:00am-6:00pm. Set per-resource overrides if a specific lane has different hours.

Blackout dates

Add holidays, private events, or maintenance days. Blackouts can be:

- **All day:** entire date blocked across all resources.
- **Time range:** e.g. Sunday 9am-2pm closed for league.
- **Per-resource:** only Lane 4 is down for repair.

Buffer times

Set in the resource's settings to add 5-15 min cleaning gaps between consecutive bookings.

TIP The engine ALSO validates on the server when the booking is submitted — even if a customer manipulates the frontend, double-booking is impossible.

10

Payments — Gateways & Transactions

G2A Booking Engine supports six payment paths out of the box. All are addons — toggle on the ones you use, ignore the rest.

Available gateways

GATEWAY	TYPE	TIER
Pay In Store	Reserve online, pay at counter.	FREE
Stripe Checkout	Cards, 2.9% + \$0.30. Industry standard.	FREE
PayPal Smart Buttons	PayPal + Venmo + Pay Later.	FREE
Fortis Pay	Lower card-present rates + ACH.	PRO
Authorize.net	Hosted page, established merchants.	PRO
WooCommerce Bridge	Any active WC gateway works.	PRO

Where to configure

Settings → Payments. Each gateway has its own card with API key fields, test-mode toggle, and a Test Connection button.

Refunds

From the Payments tab, every transaction has a Refund button. Refunds fire a hook that auto-cancels the underlying booking and notifies the customer.

Webhooks

Each gateway uses signed webhooks to confirm payment outside the customer's browser:

Stripe POST /wp-json/g2a-booking/v1/webhooks/stripe

PayPal POST /wp-json/g2a-booking/v1/webhooks/paypal

Fortis POST /wp-json/g2a-booking/v1/webhooks/fortis

Authorize.net POST /wp-json/g2a-booking/v1/webhooks/authnet

WARNING Always configure the webhook URL in each gateway's merchant portal. Without it, payments will succeed but the booking won't auto-mark as paid until the customer manually returns from the gateway.

11

Reports

Operational intel — revenue, utilization, no-show tracking. Filter by date range, export to CSV.

Available reports

Daily Bookings	Volume sparkline across the date range.
Status Breakdown	How many bookings in each status.
Top Resources	Most-booked lanes / classrooms.
Top Booking Types	Most-popular products.
Revenue	Daily and total revenue (paid + completed only).
Avg Value	Revenue ÷ booking count.
No-Show Rate	Percentage of confirmed bookings missed.

Export CSV

Click **Export CSV** to download a flat file of every booking in the date range — UUID, customer info, resource, time, amount, status. Useful for accountant handoff.

12

Settings — Tabs Walkthrough

Settings is split into modular tabs. Built-in tabs are always present. Activated addons add their own tabs (Email Templates, Invoices, AI Auto-Reply, WooCommerce).

General tab

Business name, phone, address, currency, time zone, max booking advance days, default party size, allow guest bookings toggle.

Addons tab

Card grid of every available addon. Filter by category, toggle on/off, click Configure to jump to that addon's settings tab. See Section 13 for the full addon system explanation.

Payments tab

One card per gateway with API keys, test mode toggle, default gateway selector, deposit % field.

Branding tab

Logo URL, primary color, accent color, font selection (default Rajdhani for headers + Inter for body), shortcode customization options.

Danger Zone tab

Schema migrations re-run, full data reset (requires typing RESET to confirm), seed initial demo data, export full database snapshot.

WARNING The Danger Zone **Reset All Data** button is destructive. It drops every booking, payment, and form submission. There is no undo. Always export a CSV first.

13

The Addon System

G2A Booking Engine ships with 27 modules. Some are active by default, others are toggle-on, others are marked Coming Soon. Each is a self-contained folder under `includes/modules/`.

Addon tiers

FREE	Available to everyone. Examples: Email Automation, PDF Invoices, Stripe, PayPal, Pay In Store, AI Auto-Reply.
PRO	Requires a Pro license OR Agency Mode. Examples: Fortis Pay, Authorize.net, WooCommerce Bridge, AI Auto-Reply.
AGENCY	Auto-unlocked on guns2ammo.com domain. All Pro addons available without a license check.
COMING SOON	In active development. Cards show "In active development" instead of an Activate button.

Categories

Payments	Gateways: Stripe, PayPal, Fortis, Authnet, Pay In Store, WooCommerce.
Notifications	Email, SMS (Twilio), WhatsApp, AI Auto-Reply.
Booking Features	Deposits, coupons, extras, pricing by people, waiting list.
Sales	PDF invoices, cart page, event tickets.
Developer	REST API, outbound webhooks.
Locations	Multi-location support.
Calendar & CRM	Drag-reschedule, customer profiles.
Templates	6 built-in landing templates + premium pack.
Page Builders	Elementor widgets, Gutenberg blocks.

Activating an addon

Settings → Addons → click **Activate**. The module's class boots immediately, registers any settings tabs and hooks. and starts working. Deactivate to instantly remove its hooks.

TIP Addons are wrapped in a try/catch — if a single module crashes, the rest of the plugin keeps running and the failure is logged to `wp-content/debug.log`.

14

Email Automation Module

Eight transactional emails covering the entire booking lifecycle. Branded HTML shell, 20+ merge tags, reminder cron, per-event toggles.

Lifecycle events

booking_created	Sent when the booking form is submitted. Receipt with payment link.
booking_confirmed	Sent when admin confirms (often after deposit clears).
booking_paid	Sent when full payment is received. PDF invoice attached.
booking_reminder_24h	Auto-sent 24h before start time via cron.
booking_reminder_2h	Auto-sent 2h before. Off by default — opt in.
booking_cancelled	Sent when booking is cancelled by customer or admin.
booking_no_show	Sent if customer doesn't arrive (off by default).
booking_completed	Post-visit review request (off by default).

Configuring a template

Settings → Email Templates → click an event in the side panel → edit subject and HTML body → save. Use the merge tags in either field — they're auto-replaced at send time.

Available merge tags

{customer_name} {customer_email} {customer_phone} {uuid} {resource_name} {start_at} {end_at} {duration} {party_size} {amount} {currency} {invoice_url} {pay_url} {cancel_url} {business_name} {business_phone} {business_address} {brand_color} {brand_logo_url} {site_url}

Branding all emails

Above the template editor is a single Branding section: From Name, From Email, Logo URL, Brand Color, Footer HTML. These apply to **every** email automatically — change once, every template updates.

Reminder cron

WP-Cron runs every 5 minutes. It scans for bookings whose start_at is exactly 24h or 2h ahead, fires the reminder email. and logs the send to wp_a2ab_logs so it never duplicates.

TIP On low-traffic sites, WP-Cron can stall. Set up a real cron job at your host (Hostinger Panel → Cron Jobs) to fire every 5 min: `curl https://yoursite.com/wp-cron.php`

15

Branded PDF Invoices

Auto-generated invoices for every paid booking. Logo upload, color customization, tax handling, payment-link embed for unpaid balances.

How it triggers

On `g2ab_booking_paid`, the module renders an invoice and attaches it to the payment receipt email. The customer can also access it any time via `?g2ab_invoice={uuid}` — UUID acts as an unguessable token.

PDF engine detection

The module auto-detects which PDF library is available, in priority order:

1. Dompdf (composer-installed in vendor/)
2. mPDF
3. wkhtmltopdf binary on the server
4. Browser-print fallback (HTML invoice with auto-print on load)

Customization fields

Logo URL	Replaces the brand text in the invoice header.
Header color	Background of the dark hero band.
Accent color	Border color and pay-now CTA button.
Business block	Multi-line "From" block with name + address + phone.
Footer HTML	Refund policy, terms, thank-you copy.
Invoice prefix	Prepended to the UUID. Default INV.
Tax label	e.g. "Sales Tax", "GST", "VAT".
Tax rate	Percentage as a number. Set 0 for no tax.

Live preview

Settings → Invoices → click **Open Sample Invoice** to see a fully-rendered preview with current settings against a sample booking.

TIP To install Dompdf for true server-side PDF: SSH into the server, cd to the plugin folder, run `composer require dompdf/dompdf`. Reload Settings → Invoices and the engine pill flips from "BROWSER PRINT" to "Dompdf".

16

AI Auto-Reply (OpenRouter)

Generate intelligent reply drafts to customer questions using OpenRouter free-tier LLMs. Knowledge-base aware. Tone customizable. Designed for staff review before send.

Why OpenRouter

OpenRouter exposes Llama, Mistral, Gemma, and Qwen at no cost (free tier: 20 req/min, ~50/day depending on model). One API key, OpenAI-compatible payload, switch models without code changes. No billing setup needed for the free tier.

Available free models

Llama 3.1 8B	Strongest free option for support drafts. Recommended.
Mistral 7B Instruct	Fast, concise. Good for one-line answers.
Gemma 2 9B	Google-built, balanced.
Qwen 2 7B	Strong on technical topics.
Llama 3.2 3B	Fastest. Use for simple FAQs.

Getting your API key

1. Visit openrouter.ai/keys
2. Sign in (Google / GitHub / email)
3. Click **Create Key**
4. Copy the sk-or-v1-... token
5. Settings → AI Auto-Reply → paste into API Key field → Save
6. Click **Test Connection** — should respond *pong*

Knowledge base

Q&A; pairs the AI uses to answer accurately. Five firearms-range starter entries are included (ID requirements, rentals, ammo, cancellation policy, CCW classes). Add your own to handle range-specific questions like membership tiers or league schedules.

Tone presets

professional_friendly	Default. Like a senior staffer who knows the regulars.
tactical_brief	Treat customers like experienced shooters. No fluff.
casual_friendly	Conversational, contractions, warm.
formal	Polite, full sentences, no contractions.

In-admin tester

Settings → AI Auto-Reply → Try It section. Paste a sample customer message, click **Generate Draft**, see the AI response in 5-15 seconds. Use this to tune your knowledge base before going live.

WARNING Auto-send is off by default — and should stay off. AI replies should be reviewed by staff before sending. The tool's value is shaving 80% off draft time, not replacing humans.

17

WooCommerce Bridge

Route booking checkout through WooCommerce. Customer pays with any active WC gateway. Bidirectional status sync.

Why use this

If you already have WooCommerce running with Stripe, Square, manual payment, or any other gateway configured, the Bridge lets bookings reuse that exact checkout flow. No need to re-enter API keys in our plugin's Payments tab.

How it works

1. Customer fills the booking form and clicks Reserve.
2. Plugin creates a WooCommerce order with the booking as a line item, status pending.
3. Customer redirects to /checkout/order-pay/{order_id} — Woo's pay-for-order page.
4. Customer picks any gateway and pays.
5. WooCommerce fires order_status_processing → bridge marks booking as paid + fires g2ab_booking_paid.
6. Email Automation sends payment receipt with PDF invoice attached.

Setup

1. Activate WooCommerce Bridge addon (Settings → Addons).
2. Settings → WooCommerce → click **Auto-create Placeholder Product** — generates a hidden virtual product representing all bookings.
3. Settings → Payments → set default booking gateway to woocommerce.

Status sync

Both directions:

WC processing →	Booking marked paid.
WC completed →	Booking marked paid.
WC cancelled →	Booking cancelled.
WC refunded →	Booking refunded.
Booking cancelled →	Linked WC order cancelled.
Booking completed →	Linked WC order completed.

18

Authorize.net Live Gateway

Accept Hosted (Authorize.net's hosted payment page) integration with HMAC-SHA512 webhook verification. Best for established merchant accounts.

Required credentials

API Login ID	From Account → Settings → API Credentials.
Transaction Key	Same page. Regenerate if you haven't recently.
Signature Key	New Signature Key — used for webhook signature verification.

Configure in WordPress

Settings → Payments → Authorize.net card. Paste all three credentials. Toggle Test Mode off when ready for production. Enable.

Configure silent post URL in Authorize.net

Account → Settings → Webhooks → Add Endpoint. Endpoint URL: `https://yoursite.com/wp-json/g2a-booking/v1/webhooks/authnet`. Events: `net.authorize.payment.authcapture.created`.

How the flow works

1. Customer clicks Pay.
2. Plugin requests a token via Authorize.net's `getHostedPaymentPageRequest`.
3. Customer redirects via a self-submitting form to `accept.authorize.net/payment/payment`.
4. Customer pays on Authorize.net's domain (PCI-light for you).
5. Authorize.net redirects back to `?g2ab_paid={uuid}`.
6. Silent-post webhook hits the verification endpoint with HMAC-SHA512 signature.
7. Plugin verifies signature → marks booking paid → fires lifecycle hook.

WARNING If Hostinger or your firewall blocks `/wp-json/...`, run `curl -I https://yoursite.com/wp-json/g2a-booking/v1/webhooks/authnet` first. Should return 405 (Method Not Allowed), NOT 404.

19

Stripe / PayPal / Fortis Pay Setup

Three more gateways included out of the box. Each has its own card in Settings → Payments.

Stripe Checkout

Get keys: dashboard.stripe.com → Developers → API keys. Use Test Mode keys first.

Webhook URL: /wp-json/g2a-booking/v1/webhooks/stripe

Webhook events: checkout.session.completed, payment_intent.succeeded

Webhook secret: paste into the Stripe Webhook Secret field.

PayPal Smart Buttons (Orders v2)

Get keys: developer.paypal.com → Apps & Credentials → Create App → Live or Sandbox.

Webhook URL: /wp-json/g2a-booking/v1/webhooks/paypal

Webhook events: PAYMENT.CAPTURE.COMPLETED

Webhook ID: after creating the webhook in PayPal, copy the Webhook ID into the plugin field.

Fortis Pay (PayForm)

Get credentials: contact your Fortis merchant rep for User ID, User API Key, Developer ID.

Webhook URL: /wp-json/g2a-booking/v1/webhooks/fortis

Signature: HMAC-SHA256 of payload with your shared secret.

Test mode first

Every gateway has a Test Mode toggle. Always run a full booking flow in test mode before flipping live. Use the test card numbers documented at each gateway's developer site.

Frontend Shortcodes

Drop these into any page or post to embed booking functionality.

[g2a_lane_booking]

Full stepped lane booking flow — pick lane → date → time → fill form → reserve → pay.

Attributes:

- booking_type — slug of the booking type to use (default: lane-booking)
- form — slug of the form to use
- theme — dark (default) or light

Example:

```
[g2a_lane_booking booking_type="lane-booking" form="default-lane-booking" theme="dark"]
```

[g2a_booking_form]

Render any form by ID. Useful for embedding the CCW class signup or membership form on a dedicated page.

```
[g2a_booking_form id="123"]
```

[g2a_booking_calendar]

Month-grid calendar view of upcoming events (Phase 2 — limited release).

[g2a_event_banner]

Hero banner showing the next upcoming event for a category.

```
[g2a_event_banner category="class"]
```

[g2a_upcoming_events]

List of upcoming events.

Attributes: layout (list / grid), limit, category

```
[g2a_upcoming_events layout="grid" limit="6" category="class"]
```

21

SEO Landing Pages

Every active booking type gets a landing page at `/event/{slug}/` with full schema markup. Six template designs, all unique.

How it works

On plugin activation, a rewrite rule is registered: `^event/([^\s]+)/?$ → ?g2ab_event=$matches[1]`. When a customer visits `/event/ccw-class/`, the SEO engine fetches the booking type, picks the assigned template, renders the full landing.

JSON-LD schema generated

LocalBusiness	Range info, address, phone — appears in Google Maps results.
Event	Date, time, price, availability — Rich Results.
Course	For class-category types — appears in Google Course filter.
FAQPage	Each landing has 5+ FAQ entries — surface in answer boxes.
SpeakableSpecification	AEO (Answer Engine Optimization) — voice assistants can read sections aloud.
BreadcrumbList	Cleaner search snippets.

Sitemap

`/g2a-events-sitemap.xml` auto-generates with every active event. Add it to Google Search Console manually for faster indexing.

Customizing copy

Each booking type has SEO Meta Title and Meta Description fields that override the auto-generated copy. Use these to target specific keywords — e.g. "CCW Class Mesa AZ" instead of just "CCW Class".

22

REST API Reference

Namespace: /wp-json/g2a-booking/v1/. Auth via WordPress nonce (X-WP-Nonce header) for logged-in users, or Application Password for external integrations.

Bookings

GET /bookings List bookings (paginated, filterable)
POST /bookings Create new booking
GET /bookings/{id} Single booking
PUT /bookings/{id} Update
DELETE /bookings/{id} Soft-delete
GET /bookings/{uuid}/status Public status check (used by frontend success page)
POST /bookings/{uuid}/confirm-payment Manual payment confirmation fallback

Availability

GET /availability?resource_id={id}&date;={Y-m-d}&duration;={min} Returns slot grid for a date.

Resources & Booking Types

GET /resources List resources
POST /resources Create
GET /booking-types List
POST /booking-types Create

Forms

GET /forms List
POST /forms Create
GET /forms/{id} Single form with fields

Settings & Webhooks

GET /settings All settings
POST /settings Update
POST /webhooks/{gateway} Each gateway's webhook handler (stripe / paypal / fortis / authnet)

AI Auto-Reply

POST /ai/draft Body: {message, context}. Returns {success, data: {draft, model}}.
GET /ai/test Connection test.

TIP Every endpoint enforces capability checks (manage_g2ab_*) or nonce verification. Public endpoints (status, availability) are rate-limited to 60 req/min per IP.

23

Frequently Asked Questions

Can multiple customers book the same lane at the same time?

No. The availability engine validates server-side on every submission. Even if the frontend is manipulated, double-booking is impossible at the database level.

What happens if a payment fails?

The booking stays in pending status. Customer sees an error message and can retry. After 15 minutes of inactivity, the slot is automatically released so other customers can book it.

Can I run multiple ranges from one install?

Yes — the Locations addon (free tier) supports unlimited locations with per-location resources, hours, and staff.

Does this plugin work with Elementor?

Yes for shortcode embedding. Native Elementor widgets are coming in Sprint 11.

Can customers self-cancel?

Yes — every confirmation email includes a cancel URL. By default, free cancellation up to 24h before. After that, the deposit is forfeited per your cancellation policy.

Where are uploaded waiver PDFs stored?

/wp-content/uploads/g2ab-invoices/ with .htaccess access control. Only logged-in admins or the matching customer (UUID token) can access.

How do I export all my bookings?

Reports → Export CSV with no date filter. Or hit GET /wp-json/g2a-booking/v1/bookings?per_page=10000 with an Application Password.

Can I integrate with Mailchimp / HubSpot / Klaviyo?

Use the Outbound Webhooks addon (coming soon) or hook into g2ab_booking_paid from your own snippet to POST to your CRM.

Does it support recurring bookings?

Memberships yes (via PMPro integration). Recurring lane bookings are roadmap.

What about deposits?

The Deposit Payments addon (active by default) lets you charge a percentage at booking and the rest at the range. Configure per booking type.

Can the AI Auto-Reply send emails on its own?

Yes, but it's off by default — and we recommend keeping it that way. Drafts save for staff review, then send with one click.

Is the plugin GDPR-compliant?

Form data is stored in your own database. The plugin includes a Data Export and Data Erasure handler for the WordPress Privacy tools (Tools → Export/Erase Personal Data).

Troubleshooting Guide

Problem: 500 error after activating

Fix: Plugin auto-deactivates if a fatal occurs during activation. Check `/wp-content/debug.log` for the `[G2AB]` error. To recover the site fast, rename `/wp-content/plugins/g2a-booking-engine/` to add `.disabled` via FTP — WordPress unloads the plugin on next request.

Problem: Shortcodes display as raw text

Fix: The plugin is deactivated. Activate it from WP Admin → Plugins.

Problem: Booking page is blank

Fix: Check that the booking type slug in the shortcode matches an active booking type. Then check that the form slug matches an active form.

Problem: Slots not loading on date pick

Fix: Open browser console — usually a REST endpoint 404. Confirm pretty permalinks are enabled (Settings → Permalinks → Save).

Problem: Stripe payment succeeds but booking stays pending

Fix: Webhook URL not configured at Stripe. Visit `dashboard.stripe.com` → Developers → Webhooks → Add Endpoint with the URL from Section 18.

Problem: Email not sending

Fix: WordPress `wp_mail` uses your host's SMTP by default — Hostinger sometimes rate-limits. Install WP Mail SMTP plugin and route through SendGrid, Mailgun, or your Google Workspace.

Problem: AI Auto-Reply returns "no_api_key"

Fix: Settings → AI Auto-Reply → paste OpenRouter key from `openrouter.ai/keys` → Save → Test Connection.

Problem: Reports page shows yellow notice

Fix: Old plugin build — update to v1.0+ which uses tactical-branded empty states instead of WP yellow notices.

Problem: Configure buttons go to wrong tab

Fix: Old plugin build with hardcoded TABS const. Update to v1.0+ which uses filter-driven tabs.

Problem: PDF invoices download as HTML

Fix: Server-side PDF library not installed. Install Dompdf via composer (Section 15) or accept the browser-print fallback (still works, just less elegant).

TIP Always enable `WP_DEBUG_LOG` in `wp-config.php` when troubleshooting. The plugin's safe-mode wrapper catches fatals and writes to `wp-content/debug.log` with a `[G2AB]` prefix — check there first.

Support, Updates, and Roadmap

Where to get help

Email support	support@wordpressistic.com
Build by	Wordpressistic — wordpressistic.com

Update policy

Updates ship in named sprints. Each sprint is announced via email and the in-admin dashboard. Update via WP Admin → Plugins → Update Now once available.

Sprint history

Sprints 1-7	Core plugin: scaffold, DB tables, resources, booking types, forms, availability, payments, frontend, SEO
Sprint 8	Module loader + Email Automation + PDF Invoices + AI Auto-Reply (OpenRouter) + safe-mode wrapper
Sprint 9	Modern addon UI redesign + WooCommerce Bridge + Authorize.net live gateway.
Sprint 10	Configure-button routing fix, dynamic Email Templates tab, brand-pure admin pages.

Roadmap

Sprint 11	Twilio SMS reminders + WhatsApp Cloud API integration.
Sprint 12	IMAP inbox connection + auto-reply on incoming customer email.
Sprint 13	Discount Coupons + Service Extras + Pricing by Number of People.
Sprint 14	Custom Service Duration + Event Waiting List + Cart Page.
Sprint 15	PDF Event Tickets with QR + Outbound Webhooks.
Sprint 16	Calendar drag-reschedule + Customer Profiles with lifetime value.
Sprint 17	Premium Landing Pages Pack (12 additional templates).
Sprint 18	Native Elementor widgets + Gutenberg blocks.
Sprint 19	Commercial release as RangeBook Pro by Wordpressistic.

TIP This documentation will be versioned alongside the plugin. The PDF you're reading covers v1.0 (Sprint 10). Newer versions will be available at wordpressistic.com/docs.
